

Network_Evidence/Screenshots for async calls

1.) Screenshot to show our books are fetched from api get request (fetch/async call use-case 1).

Why use AJAX : Fetching books (GET request):

Here, AJAX is used to send an asynchronous GET request to the API to fetch the list of books. This means the browser doesn't need to reload the page to get the data. The data can be dynamically inserted into the page, so users can browse books instantly. It also allows for features like live search, pagination, or filtering without interrupting the user's experience.

The screenshot displays a web browser window with the URL `https://books-fd4v.onrender.com/buyer/browse?sort=price-asc`. The page is titled "BOOKISH" and shows a "Browse Books" section with 22 books found, sorted by price from low to high. The books listed include "Dopamine Detox", "The Silent Patient", "Gunahon Ka Devta", "Deep Work", and "Six of Crows". Each book card shows its cover, title, author, price, discount, and an "ADD TO CART" button.

On the right side of the browser window, the Network tab is open, showing a list of requests. The selected request is `browse?sort=price-asc`, which is a GET request to the URL `https://books-fd4v.onrender.com/buyer/browse?sort=price-asc`. The request method is GET, the status code is 200 OK, and the response headers are visible, including `Alt-Svc`, `Cache-Control`, and `Content-Type`.

The console shows a warning message: `cdn.tailwindcss.com should not be used in production. (index):64 To use Tailwind CSS in production, install it as a PostCSS plugin or use the Tailwind CLI: https://tailwindcss.com/docs/installation`.

2.) Screenshot for post request when we add a book to cart the book is added to cart asynchronously.

Why use AJAX : Adding a book to the cart (POST request):

When a user adds a book to the cart, AJAX sends a POST request to the server with the book details. The server updates the cart in the background, and the page can immediately reflect the change (like updating the cart icon or showing a success message). This asynchronous operation makes shopping smoother because the user doesn't lose context or have to reload the entire page.

The screenshot displays a web application named 'BOOKISH' with a shopping cart interface. A green notification bar at the top states 'Book added to cart'. The cart contains two items:

Product	Price	Quantity	Total
Dopamine Detox : A Short Guide to Remove Distractions and Get Your Brain to Do Hard Things Thibaut Meurisse	₹191	1	₹191
Naruto Masashi Kishimoto	₹900	1	₹900

Below the cart, there is a 'Continue Shopping' link and a 'Clear Cart' button. An 'Order Summary' section is partially visible at the bottom.

On the right, the browser's developer tools are open, showing the Network tab. A POST request to the URL `https://books-fd4v.onrender.com/buyer/cart/add/67e9a4f482965c92e7acf6a6` is selected. The request headers show a status of 302 Found. The response headers include `Alt-Svc`, `Cache-Control`, `Content-Type`, and `Cross-Origin-Opener-Policy`.

3.) Complaint is registered asynchronously after clicking submit button using POST method.

Why use AJAX : Registering a complaint (POST request):

Submitting a complaint uses AJAX to send the form data to the server asynchronously. The server processes the request and can respond with a confirmation or error message without refreshing the page. This approach provides instant feedback, prevents data loss if the page reloads, and keeps the interface responsive, which is essential for a good user experience.

The screenshot displays a web browser window with the URL `https://books-fd4v.onrender.com/buyer/register-complaint`. The page features a green header with the "BOOKISH" logo, a search bar, and navigation links: Home, Browse Books, Pricing, Video Feed, About Us, and Contact. A green notification bar at the top states "Complaint submitted successfully". Below this is a section titled "Register a Complaint" with a "New Complaint" button. The form includes a "Subject*" field with the placeholder "Enter complaint subject" and a "Description*" field with the placeholder "Please provide detailed information about your complaint...". A footer note reads: "Please provide as much detail as possible to help us address your concern effectively."

On the right side, the browser's developer tools are open to the "Network" tab. The "register-complaint" request is selected, showing a POST method to the URL `https://books-fd4v.onrender.com/buyer/register-complaint`. The status code is 302 Found, and the response headers include "Alt-Svc", "CF-Cache-Status", "CF-Ray", "Content-Encoding", "Content-Length", "Content-Type", "Cross-Origin-Opener-Policy", and "Cross-Origin-Resource-Policy". The console at the bottom shows a warning from Tailwind CSS: "cdn.tailwindcss.com should not be used in production. To use Tailwind CSS in production, install it as a PostCSS plugin or use the Tailwind CLI: https://tailwindcss.com/docs/installation".

Thank You !
